4 QUALITY EDUCATION

AI-Powered Video Summarization for Smart Learning

Ask a lecture — or an entire course playlist — and get answers grounded in what was actually said

PROBLEM STATEMENT & OBJECTIVE

- A one-hour lecture cannot be searched — re-watching is the only option
- A course is many videos; a topic is taught across several of them
- Generic AI summaries invent facts the lecture never stated

OBJECTIVES

- Turn a video, or a whole playlist, into a searchable study guide
- Every claim traceable to a real moment in a real video
- Answer questions using only what was actually said

SOLUTION

- **Retrieval-Augmented Generation** — only retrieved transcript reaches the model
- **Course mode** — one shared index across a playlist, answers cite video + timestamp
- **Timestamp validation** — any moment not in the retrieved text is discarded
- **Grounded refusal** — returns "not covered in this video" instead of guessing

METHODOLOGY — PIPELINE

1. **Ingestion** — YouTube Transcript API
   timed transcript
2. **Chunking** — 1000 chars · 200 overlap
   overlapping chunks
3. **Embedding** — all-MiniLM-L6-v2 → ChromaDB
   384-d vectors
4. **Retrieval** — top-k 5, re-ranked
   grounding context
5. **Generation** — open-mistral-nemo
   JSON draft
6. **Output** — Key points · timings · mind map

failures & retries | *prompts & replies* | *finished summary*

7. Error handling & validation
8. Red teaming — injection, safety, bias
9. Evaluation & human review (offline)

Stages 1–6 run in fixed order; layers 7–9 apply across all of them. Stage 9 is reviewed offline — scores never change a setting on their own.

GENAI MODEL & TECHNIQUES

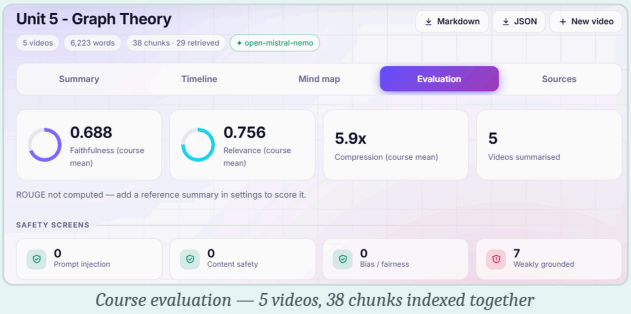

Generation by **open-mistral-nemo** (Mistral) · embeddings by **all-MiniLM-L6-v2** · vector store **ChromaDB**

- Retrieval-Augmented Generation
- Role prompting
- Grounding constraint
- Structured output (JSON schema)
- Few-shot exemplar

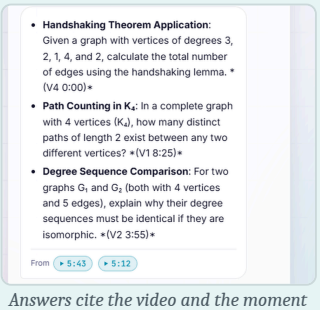

OUTPUT & RESULTS

Mind map across the whole playlist

Course evaluation — 5 videos, 38 chunks indexed together

- **Handshaking Theorem Application**: Given a graph with vertices of degrees 3, 2, 1, 4, and 2, calculate the total number of edges using the handshaking lemma. *(V4 0:00)*
- **Path Counting in K_4**: In a complete graph with 4 vertices (K_4), how many distinct paths of length 2 exist between any two different vertices? *(V1 8:25)*
- **Degree Sequence Comparison**: For two graphs G_1 and G_2 (both with 4 vertices and 5 edges), explain why their degree sequences must be identical if they are isomorphic. *(V2 3:55)*
